STAMINAL CELLS: MEDICINE'S NEW BORDER – A HOPE FOR THE FUTURE

The destruction of the textural architecture of an organ, due to the death of its cells, is the cause of the main pathologies that afflict industrialized countries population. Staminal cells, embryonal, fetal, from umbilical cord or adult, represent an important possibility for the damaged organs regeneration.

Staminal cells transplantation could be a revolutionary therapeutic perspective for several pathologies today still incurable and, in the near future, research could make big progress, treating and solving some of the most famous severe degenerative and functional diseases as:

Alzheimer

Cancer

Diabetes

Parkinson disease

Multiple sclerosis

Cirrhosis of the liver

Huntington's disease

Muscular dystrophy

Leukaemia

Osteoporosis

Haemopharm Group devotes itself to study and research of systems suitable for the conservation of stem cells.
